                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   74 protein (AAN90619) inhibits extracellular and cell-to-cell spread of HIV. The therapeutic agent consists of amino acids +3+185 fused to +351-+369; +3+106 fused to +351-+369; or +3+185. Also used to identify inhibitors of 74+ interactions, as target carrier proteins, and to generate monoclonal antibodies. Above features are: Domain 1 (D; starting at the N-terminal) = leader; D2 = variable-like-l; D3 = joining-like-l; D4 = V2; D5 = V3; D6 = J3; D7 = U3; D8 = J4; D9 = transmembrane; D10 = cytoplasmic; Regions are extracellular cysteines; and the 2 sites are potential N-linked glycosylation sites. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 24-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                proteins with C4-binding protein. Truncated, soluble versions of CD4 can also be used. The C4bp-CD4 fusion protein may be useful to target AZT or similar anti-retroviral agent to HIV-infected cells. See AAQ13242-51. (Updated on 25-WAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                      New C4 binding protein fusion proteins and DNA encoding them - comprise assemblies of C4bp monomers linked to functional moiety, e.g. AZT, useful as delivery vehicles in diagnosis and therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disulfide-bond

        Human; T4 glycoprotein; human immunodeficiency virus; HIV; envelope glycoprotein; AIDS; virus binding.
                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the soluble human T4 protein of the invention. The soluble human T4 protein blocks the binding of HIV to T4+ cells and is therefore useful for the treatment of AIDS. Monoclonal antibodies against the T4 protein may be used as vaccines for immunising subjects
                                                                                                                                                                                                                                                                                                                                                   Sequence

                                                                                                                                                                                                                                                   The present sequence represents a human T4 glycoprotein. An aqueous-soluble polypeptide comprising a portion of a human T4 glycoprotein specifically forms a complex with a human immunodeficiency virus (HIV) envelope glycoprotein. The DNA is useful for producing the soluble surface T4 glycoprotein. The soluble surface T4 glycoprotein is useful as a therapeutic agent, i.e. as prophylaxis for treating a subject infected with an HIV virus. Thus, the soluble T4 glycoprotein is useful for treating human AIDS. The soluble T4 glycoprotein is also useful in diagnostic or screening assays, e.g. for screening inhibitors of virus binding, or for detecting and quantitating T4, T4+ cells and antibodies to T4, which are of diagnostic value for AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid encoding a human T cell surface protein and soluble surface T4 glycoprotein that it encodes, useful as prophylaxis for treating a subject infected with human acquired immune deficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2000-505203/45.

                                                                                                                                                                                              This sequence represents a fusion protein between the CD4 extracellular domain and the eta protein membrane spanning domain and intracellular domain and the eta protein membrane spanning domain and intracellular domain. Eta is an isoform of zeta (see also AARZ7276) which is a 3 kD type I integral membrane homodimer, which arises by alternate mRNA splicing. It is present in reduced amounts in cells expressing the T cell antigen receptor. Zeta-eta heterodimers are thought to mediate the formation of inositol phosphates, as well as the receptor initiated cell death called apoptosis. In the production of the CD4 receptor chimera, the eta cDNA was isolated from the HPB-ALL tumour cell line and from human natural killer cells. The eta cDNA was joined to the extracellular domain of an engineered form of CD4 possessing a BamHI site just upstream of the membrane spanning domain, by a BamHI site naturally present a few residues upstream of the membrane spanning domain. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Therapeutic cells expressing chimeric receptors - directing cellular response to an infective agent, useful in treating HIV-1, AIDS Pneumocystis carinii infections etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 25-MAR-2003

                                                                                                                                                                                                                                                                                                                                                                                                                   portion of the CD7 (see AAR89440), CD5 or CD34 transmembrane domains. Alternatively, the extracellular portion of the receptor can be separated from the intracellular domain by the hinge, CH2 and CH3 domains of human IgG1 (see AAR89441). The extracellular portion of the chimeric receptor contains a fragment of CD4 (amino acids 1-394 or 1-200 of the CD4 sequence, see AAR89450 and AAR89451) which specifically recognises and binds HIV-infected cells, but does not mediate HIV infection. The extracellular domain of the receptor is separated from the cell membrane by 48 or 72 angstroms, or by one or more proteinaceous alpha-helices. The cells expressing the receptor are preferably T cells, B cells, neutrophils, or dendritic cells. The therapeutic cells expressing the chimeric receptor are administered to a mammal to treat HIV infection
                                                                                                                                                                                                                                                                                                                                                                   Sequence 462 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAT10801-T10803 represent membrane bound proteinaceous chimeric receptors of the invention. This sequence represents the CD4:gamma chimera. The transmembrane region of the chimeric receptor acts to separate the intracellular and extracellular domains of the chimera, and contains a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Membrane-bound chimeric receptor comprising extracellular portion including CD4 fragment - cells expressing receptor can be used for treatment of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CD7; transmembrane domain; chimeric receptor; CD5; CD34; CH2; CH3; IgG1; human; CD4; HIV; proteinaceous alpha-helix; T cell; B cell; neutrophil; dendritic cell; therapy; mammal; infection.

       engineered form of the CD4 cellular receptor for HIV and the transmembrane and intracellular regions, including the cytolytic signal-transducing portion, of the human Fc receptor gamma chain; the region of the fusion is shown in AAW02223. It can be obtd. by inserting a gene fusion (AAT36759) into a vaccinia virus vector and expression in host cells. Chimaeric receptors comprising CD4 fused to Fc receptor gamma or Tecal receptor zeta (see also AAW02213) or eta (AAW02215) chains are capable of directing cycotoxic T lymphocytes to specifically recognise and kill cells expressing HIV gp120, thus providing a therapy for AIDS

         The present invention describes DNA encoding a membrane-bound chimeric receptor comprising: (a) an extracellular portion that specifically recognises and binds a target cell or a target infective agent; and (b) an intracellular portion of a T-cell receptor CD3, zeta or eta polypeptide, a B-cell receptor polypeptide or an Fc receptor polypeptide. The present sequence represents a chimeric receptor containing the mouse gamma polypeptide. Cells expressing chimeric receptors of the present invention can be administered to mammals in order to destroy pathogens.
                                                                                                                                                                                     Membrane-bound chimeric receptors - which recognises and binds a target e.g. a T-cell receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; zeta; eta; gamma; membrane-bound chimeric receptor; infection; tumour; cancer cell; autoimmune-generated cell; T cell receptor; CD3; CD4; B cell receptor; Fc receptor; pathogen; bacterial; fungal;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                         Example

 This sequence represents a fusion protein between the CD4 extracellula domain and the gamma protein membrane spanning domain and intracellula domain and the Fc-receptor-associated gamma chain is expressed in cell surface complexes with additional polypeptides, some of which mediate ligand recognition, and others which have undefined function. Gamma be a homodimeric structure and overall organisation very similar to that zeta (see also AAQ28704), and is a component of both the mast cell/basophil high affinity IgE receptor, Fc-epsilon-RI, which consist

Best Local
cell receptor zeta, gamma or eta (AAR78676-78, respectively) were expressed in CVI using a vaccine virus vector. These CD4:zeta, CD4 and CD4:eta chimeric receptors mediated cytolysis of Franciscus, CD4 HIV gp120/41
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              of at least three distinct polypeptide chains and one of the low affinity receptors for IgG, represented in mice by Fc-gamma-RII-alpha. In the production of the CD4 receptor chimera, the gamma cDNA was isolated from the HPB-ALL tumour cell line and from human natural killer cells. The gamma cDNA was joined to the extracellular domain by engineering a BamHI site just upstream of the membrane spanning domain, by a BamHI site naturally present a few residues upstream of the membrane spanning
                                                                                                                                                            Example
                                                                                                                                                                                                                                 Target
                                                                                                                                                                                                                                                                                  WPI; 1995-292893/38.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
             AAT10801-T10803 represent membrane bound proteinaceous chimeric receptors of the invention. This sequence represents the CD4:eta chimera. The transmembrane region of the chimeric receptor acts to separate the intracellular and extracellular domains of the chimera, and contains a portion of the CD7 (see AAR89440), CD5 or CD34 transmembrane domains. Alternatively, the extracellular portion of the receptor can be separated from the intracellular domain by the hinge, CH2 and CH3 domains of human 1gG1 (see AAR8941). The extracellular portion of the chmeric receptor contains a fragment of CD4 (amino acids 1-394 or 1-200 of the CD4 sequence, see AAR8945) and AAR89451) which specifically recognises and
                                                                                                                                                                                                                                                                                                                                                                        Membrane-bound chimeric receptor comprising extracellular portion including CD4 fragment - cells expressing receptor can be used for treatment of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CD7; transmembrane domain; chimeric receptor; CD5; CD34; CH2; CH3; IgG1; human; CD4; HIV; proteinaceous alpha-helix; T cell; B cell; neutrophil;

The cells expressing the receptor are preferably T cells, B cells, neutrophils, or dendritic cells. The therapeutic cells expressing the chimeric receptor are administered to a mammal to treat HIV infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     transmembrane and intracellular regions, including the cytolytic signal-transducing portion, of the mouse T-cell receptor eta chain. It can be obtd. by inserting a gene fusion (AAT36760) into a vaccinia virus vector and expression in host cells. Chimaeric receptors comprising CD4 fused to eta, eta (see also AAW02213) or Fc receptor gamma (see also AAW02214) chains are capable of directing cytotoxic T lymphocytes to specifically recognise and kill cells expressing HIV gp120, thus providing a therapy for AIDS. (Updated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes DNA encoding a membrane-bound chimeric receptor comprising: (a) an extracellular portion that specifically recognises and binds a target cell or a target infective agent; and (b) an intracellular portion of a T-cell receptor CD3, zeta or eta polypeptide, a B-cell receptor polypeptide or an Fc receptor polypeptide. The present sequence represents a chimeric receptor containing the human eta polypeptide. Cells expressing chimeric receptors of the present invention can be administered to mammals in order to destroy pathogens (e.g. bacteria, fungi, protozoa or viruses, especially HIV), cancer cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Membrane-bound chimeric receptors - which recognises and binds a target e.g. a T-cell receptor.

                                                                                                                                                                                                                                                                                                      domain. Zeta is a 32 kD type I integral membrane homodimer which has a 9 residue extracellular domain and a 112/113 residue intracellular domain for mouse and human protein respectively. In the production of the CD4 receptor chimera, the zeta cDNA was isolated from the HPB-ALL tumour cell line and from human natural killer cells. The zeta cDNA was joined to the extracellular domain of an engineered form of CD4 possessing a BamHI site just upstream of the membrane spanning domain, by a BamHI site naturally present a few residues upstream of the membrane spanning domain. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAT10801-T10803 represent membrane bound proteinaceous chimeric receptors of the invention. This sequence represents the CD4:zeta chimera. The transmembrane region of the chimeric receptor acts to separate the cransmembrane region of the chimera receptor acts to separate the cransmembrane region of the chimera receptor acts to separate the cransmembrane and extracellular domains of the chimera, and contains a portion of the CD7 (see AAR89440), CD5 or CD34 transmembrane domains. Alternatively, the extracellular portion of the receptor can be separated from the intracellular domain by the hinge, CH2 and CH3 domains of human CC [361 (see AAR89441). The extracellular portion of the chimeric receptor contains a fragment of CD4 (amino acids 1-394 or 1-200 of the CD4 sequence, see AAR89450 and AAR89451) which specifically recognises and binds HIV-infected cells, but does not mediate HIV infection. The cutracellular domain of the receptor is separated from the cell membrane CC by 48 or 72 angstroms, or by one or more proteinaceous alpha-helices. The cells expressing the receptor are preferably T cells, B cells, CC cells expressing the receptor are preferably T cells, B cells expressing the receptor are preferably T cells and the cell membrane CC cells expressing the receptor are preferably T cells and the cell sexpressing the receptor are preferably T cells and T cells expressing the cells can be administered to a mammal to treat HIV infection or the content of the content o

It can be obtd. by inserting a gene fusion (AAT36758) into a vaccinia virus vector and expression in host cells. Chimaeric receptors comprising CD4 fused to zeta, eta (see also AAW02215) or Fc receptor gamma (see also AAW02214) chains are capable of directing cytotoxic T lymphocytes to specifically recognise and kill cells expressing HIV gp120, thus providing a therapy for AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Direction of cellular immune response using therapeutic cell expressing chimacric receptors - comprising region binding to target cell and region that signals target cell destruction, or CD28 region, partic. for eliminating HIV-infected cells.

                                                                                                                                                     Matches
                                                                                                                                                                           Query Match
                                                                                                                                                                                                                           receptor comprising: (a) an extracellular portion that specifically recognises and binds a target cell or a target infective agent; and (b) an intracellular portion of a T-cell receptor CD3, zeta or eta polypeptide, a B-cell receptor polypeptide or an Fc receptor polypeptide. The present sequence represents a chimeric receptor containing the human zeta polypeptide. Cells expressing chimeric receptors of the present invention can be administered to mammals in order to destroy pathogens (e.g. bacteria, fungi, protozoa or viruses, especially HIV), cancer cells or autoimmune-generated cells
                                                                                                                                                                                                                                                                                                                                                                                             Membrane-bound chimeric receptors - comprising extracellular portion which recognises and binds a target cell and an intracellular portion e.g. a T-cell receptor.
                                                                                                                                                                                                      Sequence 575
                                                                                                                                                                                                                                                                                                                                                                       Example

31-OCT-2002
29-MAY-1990
                                                                                                                                                                                                                                                                                                                                                                                                           X = stop codon. The sequence was deduced from the cDNA insert of pBG183. Soluble T4 constructs may be produced by truncating this sequence to give fragments from position 400 to 799, removing the transmembrane and intracytoplasmic domains whilst retaining the extracellular region responsible for HIV binding. The sol. T4 is combined with an anti-viral agent such as AZT. See also AAQ03005. (Typis combined with an anti-viral missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Combinations of soluble synergistic activity in

Transmembrane and cytoplasmic domain-encoding regions are deleted from the T4 CDS to encode a truncated protein. The soluble forms may be modified to increase their immunogenicity by addition of an adjuvant su as incomplete Freund's adjuvant. The T4 interferes with HIV/T4 interaction and elicits anti-soluble T4 antibody prodn. See also AAQ05607. (Updated on 31-OCT-2002 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              plasmid

The purified vector containing the kappa light chain constant region is then ligated to human CD4 cDNA. The cDNA is used to prepare an expression vector encoding the light chains of a CD4-IgG1 chimeric heterotetramer designated CD4-KLC-pRcCMV (ATCC 75194). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CD4-gamma 1 chimeric heavy chain homo-dimer and its expression vector - for preventing and treating HIV infection useful as a diagnostic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Beaudry

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                    comprising the radionuclide can be used to image HIV infected tissue, to calculate the stage of HIV infection or the efficacy of an anti-HIV treatment using the imaging technique and for determining the prognosis of an HIV infected subject. (Updated on 25-MAR-2003 to correct PN field
                                                                                                                                                              A tetramer comprising 2 IgG2 heavy chains or two CD4-IgG2 chimeric heavy chains and two kappa light chains or CD4-kappa light chains (AAR46680) linked to a non-peptidyl toxin or a gamma radiation-emitting radionuclide of low to moderate cytotoxicity. The resulting immunoconjugate comprising the toxin can be used to kill HIV infected cells and to treat HIV infected cells to reduce the population of HIV infected cells. It can also be used to reduce the likelihood of infection. The immunoconjugate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Non-peptidyl toxin or radionuclide and CD4-gamma 2 or CD4-IgG2 immuno:conjugates - used to kill HIV-infected cells and to image and stage HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CD4; gamma; heavy chain; chimeric; chimaeric; immunoconjugate; HIV; human immunodeficiency virus; radionuclide; toxin; therapy; treatment; imaging; detection; targetting; immunoglobulin; IgG.

The coding sequenc is derived from the published sequence of sT4. sT4 useful in the prevention and treatment of ADS by inhibiting spread of the virus. It can also be used as an inhibitor of T4+ cell function, a reagent for identifying inhibitors of T4+ cell interaction and to produce the contraction of the contraction and to produce the contraction and the contraction and

                                                             The invention relates to antibodies or antibody fragments specifically binding to CD4-inducible epitope on Human immunodeficiency virus (HTV) envelope glycoprotein (Env) proteins. The antibody is useful for preparing a composition for treating or preventing HTV infection. The invention is used to prepare vaccines and is used in gene therapy. The present sequence is a sCD4 protein used in the exemplification of the
                                                                                                                                                                                                                                                               New isolated antibody or antibody fragment specifically inducible epitope on Human Immunodeficiency Virus (HIV) useful for preparing a composition for treating or preveinfection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8CD4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diagnostic monoclonal antibodies. The signal sequence is attached downstream of the plasmid sequence encoding a secreted protein, which will then produce proteins covalently anchored to the cell surface in which they were produced. This can give rise to plasma membrane binding, enhanced purifiability, micelle formation etc. especially useful in the production of chimeric targeted drugs, to produce micellular or liposomal delivery systems or in enhanced purification and screening of cells, proteins or DNA libraries. ```

The signal encoding a anchored to

al sequence is attached downstream of the Plasmid sequence a secreted protein, which will then produce proteins covato the cell surface in which they were produced. This can

covalently

give

CC This sequence represents the full length amino acid sequence of CC glycosylated sT4 glycoprotein. Human immunodeficiency virus (HIV) uses CC sT4 as a target receptor on T cells. The invention relates to CC glycosylated sT4 which functions by blocking the binding of HIV to T4 CC target cells, and can be used for the prophylaxis and treatment of AIDS CC patients. Administration of sT4 effectively inhibits the cell to cell CC spreading of HIV infection and also the fusion of HIV-infected T4 cells CC and non-infected T4 cells. The administration of T4 alleviates several CC symptoms associated with AIDS, and prevents the occurrence of new pathological changes. The sT4 glycoprotein is useful for the prophylaxis CC and treatment of patients with AIDS. It is also useful as a reagent to therapeutic agents or inhibitors of T4+ cell interactions and in CC diagnostic assays for detection T4 proteins or malcules which act as

      The present sequence is that of fusion protein CD4Mmu comprising the extracellular portion of CD4, which binds to HIV gp120, linked at itt terminus to the human IgM heavy chain. To obtain the fusion protein, encoding CD4 was linked to IgM DNA at the Mst2 site upstream of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CD4 - IgM

Fusion protein CD4Mmu and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgM fusion proteins such as CD4Mmu provide complement-mediated immunity

The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gp120. The fusion protein is useful for treating human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). This sequence represents the fusion protein CD40Mg which is constructed from CD4 linked to human IgM upstream of the CH1 region
This sequence represents the amino acid sequence of glycosylated sT4 glycoprotein. Human immunodeficiency virus (HTV) uses sT4 as a target receptor on T cells. The invention relates to glycosylated sT4 which functions by blocking the binding of HTV to T4 target cells, and can be used for the prophylaxis and treatment of AIDS patients. Administration of sT4 effectively inhibits the cell to cell spreading of HTV infection and also the fusion of HTV-infected T4 cells and non-infected T4 cells.
                                                                                                                                                                       Soluble T4 glycoprotein useful for prevention immunodeficiency syndrome and for screening ir

The sT4 glycoprotein is useful for the prophylaxis and treatment of patients with AIDS. It is also useful as a reagent to identify natural, synthetic or recombinant molecules which act as therapeutic agents or inhibitors of T4+ cell interactions and in diagnostic assays for detection T4 proteins

The method uses an interfacial optical assay, such as surface plasmon resonance (SPR). The method is useful for screening candidate compounds for the ability to inhibit interaction between MHC/peptide complex and Tell receptor, and MHC/peptide complex and CDB or CD4 co-receptor. The compounds identified by the above methods which interfere with T cell receptor binding to a particular HLA type molecule are useful as immune inhibitors for treating carcinomas, autoimmune diseases such as multiple archive is the monodeficiency virus (HIV) infection, rheumatoid arthritis, Hashimoto's disease, insulin dependent diabetee, Good

Human CD4 extracellular domains 1 an 2 were used in the construction of CD4 ollgomerisation fusion proteins. The fusion proteins contain an ollgomerisation domain that enables the proteins to bind to one another to form ollgomers. The ollgomers may be

An antibody for the treatment or prevention of HIV-infection comprises gp120 portion which binds to DC-SIGN or is exposed upon gp120 binding DC-SIGN due to concomitant conformational change.
                                                                                                                                         of a

Query Match Best Local S The specification describes an antibody which is specific for an antigenic fragment of gp120. This antigenic fragment binds to DC-SIGN or is exposed upon gp120 binding of DC-SIGN due to concomitant conformational change. DC-SIGN is a receptor that is specifically expressed on dendritic cells and facilitates infection of T lymphocytes with HIV. DC-SIGN is identical to a HIV-1 gp120-binding C-type lectin. I -SIGN binds ICAM-3 (which is expressed constitutively on T lymphocytes) with high affinity. The antibody of the invention inhibits the trans enhancement of HIV entry into a T cell or macrophage facilitated by dendritic cells. The antibody is useful to treat or prevent HIV infection. The present sequence represents a human CD4 protein Sequence 458 AA; 77.78; Score 1023; DB 4; Pred. No. 4.8e-63; .4 Length ဝူ g

RESULT 64
ADE57489
  comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a control that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal control to pain, a method for identifying an agent compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an enthod for identifying a compound which regulates the extraction, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypuptides or their antibodies. The polynucleotide given in the composition, a method for identifying a compound useful in treating polypoptides or their antibodies. The polynucleotide or the compound that composition comprising the one or more compound that sits activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction conjury (CCC) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at fra winch in the part of the form willow at the composition of the printed control to the printed specification at the control control control to the printed co
Sequence 458
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           14-AUG-2001; 2001US-0312147P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
The invention relates to a composition for the treatment or prevention of human immunodeficiency virus-1 (HIV-1) infection. The composition comprises CD4+ cells that have been transduced with a vector that encode a chimeric CD4 molecule which is capable of being retained in the endoplasmic reticulum (ER). The invention also encompasses the use of a soluble protein factor produced by CD4+ cells that have been transduced with a vector encoding a chimeric CD4 protein; and the use of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HIV-1 infection; human immunodeficiency virus-1; CD4+ cell; chimeric endoplasmic reticulum; ER retention; envelope protein gp160; T cell receptor CD3epsilon chain; C-terminal domain; CD4epsilon15;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HIV-1 infection;
